## Hiring Team - Time Series Machine Learning Intern

Schneider Electric · Sophia Antipolis, France

Dear Schneider Electric Hiring Team,

Detecting anomalies in industrial equipment before they cause failure is exactly the problem I built toward at EURECOM: a **transformer autoencoder** for **unsupervised fault detection** on industrial audio signals, achieving **AUC 0.80** with zero labeled anomaly examples - evaluated on a DCASE-style protocol matching state-of-the-art unsupervised baselines. That project sits at the precise intersection of time series modeling and industrial reliability that this role targets.

Beyond that project, at **Orange Maroc** I engineered an end-to-end **ML pipeline over 100K+ live telemetry records** - sequential, timestamped network signals - using **Random Forest and KMeans** with feature engineering and cross-validated evaluation, reducing manual analysis time by **~60%** and mapping outputs directly to business decisions. I also ran structured **ablation experiments** across model depth, learning rate schedules, and augmentation strategies on a 428M-parameter model, proving that disciplined experimentation is how I validate every design choice.

Schneider Electric's EcoStruxure platform sits at the center of industrial IoT - where time series data from connected assets drives real operational decisions, not research demos. I want to build the models that make that layer reliable. I would welcome the chance to discuss how my background fits the team's current work.

Sincerely,

**AYMANE AIT DADS**
