Hiring Team - Software Dev Engineer Intern Machine Learning, Amazon Robotics

Amazon Robotics · North Reading, MA, USA

Dear Amazon Robotics Hiring Team,

Amazon Robotics needs engineers who can build **scalable ML systems** that ship directly to production environments - the kind that operate at warehouse scale, on real hardware, under real constraints. That is exactly what I built at EURECOM: ranked **#1 on the private leaderboard** by fine-tuning **CLIP ViT-L/14 (428M parameters)** on 250K samples, using FP16 mixed precision and GradScaler to stay within a T4 GPU budget - not a research cluster, a single constrained device. Production constraints first, model performance second.

At Orange Maroc, I owned an **end-to-end ML pipeline** covering **100K+ telemetry records**, combining Random Forest and KMeans to identify the top 3 network-quality drivers and reduce manual analysis time by **~60%** - proof I can take a problem from raw data ingestion to decision-ready output. Separately, my transformer autoencoder for **unsupervised anomaly detection** on industrial audio reached **AUC 0.80** with no labeled anomalies - directly relevant to the sensor-heavy, fault-detection challenges inside a robotics fulfillment system.

Amazon Robotics moves over **750,000 robotic drive units** across fulfillment centers worldwide - every ML model running on that fleet has to generalize, stay efficient, and fail gracefully. I want to be in the room where those tradeoffs get made. I would welcome the chance to discuss how my work fits your current roadmap.

Sincerely,

AYMANE AIT DADS
