Hiring Team - INTERNSHIP - SOLIDWORKS DEVOPS AI

SolidWorks · Vélizy-Villacoublay, France

Dear SolidWorks DevOps AI Hiring Team,

Your JD calls for someone who can **analyze build logs, pipeline outputs, and system telemetry** using AI - exactly the problem space I worked in at Orange Maroc, where I engineered an **end-to-end ML pipeline** over **100K+ network telemetry records**, reducing manual analysis time by ~60% and delivering actionable insights directly to senior management. Correlating signals across a live distributed system to surface root causes is not a side project for me - it is what I have shipped in production.

On the **LLM and NLP** side, I have hands-on experience fine-tuning transformer architectures - including a **428M-parameter CLIP ViT-L/14** model on 250K samples - and building complete NLP pipelines from tokenization through transformer fine-tuning, improving classification accuracy by **12 percentage points** over baseline. For the **anomaly detection** requirement in your alerting and monitoring layer, I built an unsupervised transformer autoencoder achieving **AUC 0.80** on industrial fault detection with zero labeled anomalies - directly applicable to detecting failure patterns across CI/CD pipelines.

SolidWorks powers the engineering workflows of millions of product designers worldwide, and bringing AI intelligence into the release engineering infrastructure that underpins that platform is a consequential problem. I would welcome the chance to discuss how my telemetry pipeline work and LLM experience map to what your team is building.

Sincerely,

AYMANE AIT DADS
