Hiring Team - PhD Student Intern - AI Research

SAP · Sophia Antipolis, France

Dear SAP AI Research Hiring Team,

Your requirement to **conduct state-of-the-art research on AI agent improvement** using structured feedback to enable continuous learning maps directly to work I have been doing at EURECOM: designing **ablation experiments** across transformer unfreezing depth, learning rate schedules, and augmentation strategies to understand how fine-tuned models generalize - and proving that 1-epoch fine-tuning of a **CLIP ViT-L/14 (428M parameters)** preserves out-of-distribution robustness better than extended re-training, which earned the #1 rank on the EURECOM private leaderboard across 250K training samples.

Your focus on **reinforcement learning** and **LLM agent research** within enterprise environments connects to two additional strengths. First, my transformer autoencoder for unsupervised fault detection achieved **AUC 0.80** with no labeled anomalies - a setting that closely mirrors the sparse, unstructured feedback loops that RL agents face in real deployments. Second, I built a complete NLP pipeline from TF-IDF through **transformer fine-tuning** that improved sentiment classification accuracy by **12 percentage points** over baseline, demonstrating the kind of iterative, benchmark-driven experimentation your team publishes at top-tier venues.

SAP's ambition to scale AI methods across 80% of global commerce - and specifically the bet on agentic AI that continuous learning can adapt across diverse enterprise environments - is a research problem worth working on. I would welcome the chance to discuss how my experimentation background fits your team's current agenda.

Sincerely,

AYMANE AIT DADS
