Hiring Team - Software Engineer Internship

Gravis Robotics · Zurich, Switzerland

Dear Gravis Robotics Hiring Team,

Your Platform Team needs someone who can **own observability tooling that the whole company depends on** - the kind of infrastructure work where a missed regression can ground an entire fleet. At Orange Maroc, I owned exactly that kind of end-to-end system: an **ML pipeline covering 100K+ telemetry records** that went from raw data ingestion to dashboards used by senior management, reducing manual analysis time by **~60%**. I know what it means to build something other people rely on daily.

Two details from your stack directly map to work I have shipped. First, **observability and profiling**: my Orange Maroc pipeline applied cross-validated modeling and feature engineering on live network telemetry to surface the top 3 performance drivers - the same diagnostic thinking your team uses to detect and resolve regressions across onboard machines and cloud services. Second, **performance at scale**: fine-tuning **CLIP ViT-L/14 (428M parameters)** on **250K samples** under a T4 GPU budget forced me to implement **FP16 mixed precision with GradScaler** and design inference pipelines that hold under out-of-distribution load - the same constraint your Platform Team faces when optimizing software across a development fleet.

Gravis is the rare team applying learning-based autonomy to physical construction machines at scale - not a simulation, not a demo, but a fleet operating in the real world. The Platform Team's role of giving engineers the confidence to ship faster on that foundation is exactly where I want to contribute. I would welcome the chance to discuss how I can take ownership of your **Prometheus / Grafana / OpenTelemetry** stack this summer.

Sincerely,

AYMANE AIT DADS
