Hiring Team - Intern Software Engineer - Edge AI Engineering

RooflineAI GmbH · Germany

Dear RooflineAI Hiring Team,

RooflineAI's mission to **simplify AI deployment at the edge** by transforming how models run on **diverse hardware** maps directly to a constraint I have already worked under: fitting a **428M-parameter CLIP ViT-L/14** within a single T4 GPU budget while preserving generalization - ranked #1 on the EURECOM private leaderboard across 250K training samples and 25+ generator types.

Squeezing performance from limited compute is the core of edge AI engineering. I applied **FP16 mixed precision with GradScaler** to cut memory overhead and designed **10-view test-time augmentation** for robust out-of-distribution inference - both directly relevant to deploying models under edge hardware constraints. Separately, I built a **transformer autoencoder** for unsupervised industrial fault detection achieving **AUC 0.80** with zero labeled anomalies, proving I can architect efficient inference pipelines beyond standard supervised settings.

RooflineAI sits at exactly the inflection point where model performance meets hardware reality - the "roofline" framing itself signals a team that thinks in compute ceilings, not just accuracy numbers. I want to contribute to that deployment stack directly. I would welcome the chance to discuss how my work fits your current engineering priorities.

Sincerely,

AYMANE AIT DADS
