Hiring Team - Machine Learning Intern, Applied Mobility Intelligence

Cambridge Mobile Telematics · Cambridge, MA, USA

Dear CMT Hiring Team,

CMT's DriveWell Fusion platform fuses **sensor data from millions of IoT devices** with contextual signals to model driver behavior at scale - exactly the kind of problem I have been building toward. At Orange Maroc, I engineered an **end-to-end ML pipeline** over **100K+ live telemetry records**, surfacing the top 3 network-quality drivers and cutting manual analysis time by roughly 60% - a full-stack signal-to-insight system built under real operational constraints.

Two more data points that map directly to Applied Mobility Intelligence work: first, I delivered a **KMeans segmentation** model that mapped **5 distinct user performance profiles** to commercial service tiers, feeding go-to-market decisions - the kind of behavioral clustering that underpins usage-based insurance scoring. Second, I built a **transformer autoencoder** for unsupervised anomaly detection on industrial sensor streams, reaching **AUC 0.80** with zero labeled anomalies - directly transferable to detecting irregular driving events in unlabeled telematics feeds.

CMT processes data from more smartphone-based telematics programs than any other provider globally, and the DriveWell scoring engine feeds real underwriting decisions - that production stakes environment is where I want to contribute. I would welcome the chance to discuss how my pipeline and modeling background fits the team's current roadmap.

Sincerely,

AYMANE AIT DADS
