Hiring Team - AI Engineering Intern

Destinus · Zurich, Switzerland

Dear Destin AI Team,

Your role calls for engineers who can **benchmark and adapt Vision Language Action models** for real autonomous systems - not lab prototypes. Fine-tuning **CLIP ViT-L/14 (428M parameters)** on **250K multimodal samples** spanning 25+ generative architectures, and ranking **#1 on the EURECOM leaderboard**, is exactly the kind of large-scale multimodal adaptation work that translates directly into what Destin needs on edge-deployed flight hardware.

Two achievements map directly to your pipeline. First, to support **low latency inference** under real hardware constraints, I applied **FP16 mixed precision with GradScaler** and designed **10-view test-time augmentation** to maintain robustness under out-of-distribution inputs - the same pressure a drone faces in noisy tactical environments. Second, to demonstrate **fine-tuning multimodal datasets** end-to-end, I built a complete NLP pipeline from raw tokenization through **transformer fine-tuning**, improving sentiment classification accuracy by **12 percentage points** over baseline - showing I can own the full data-to-model loop independently.

Destinus is pushing UAV autonomy into defense-critical operations where latency and reliability are non-negotiable - that specific constraint, voice commands collapsing into real-time drone actions on edge compute, is a systems problem I want to work on. I would welcome the chance to discuss how my background fits your current pipeline priorities.

Sincerely,

AYMANE AIT DADS
